HH - HeadHunter (cont.)

In this laboratory work you have to continue a project from the Lab 9.

Back-End - "hh-back":

1. Copy your project from Lab 9 CRUD for all models (Company, Vacancy) using:
   a. function based views
   b. class based views
2. Using DRF serializers:
   a. at least one of them using `serializers.Serializer` and one of them using `serializers.ModelSerializer`

Back-End - "hh-front":
Create angular project with name "**hh-front**"
1. Create necessary **interfaces**: **Company, Vacancy**
2. Create necessary **services** for getting data from back-end
3. Show list of **Companies**
4. When you click to one **company** it must show vacancies for the currently selected item.
